

helsemelding-attachment-service

The service stores files attached to messages and exposes an API to retrieve them.

API

The service exposes REST endpoints for storing and retrieving attachments:

Store attachments

POST /attachments/{messageId}

Accepts a list of attachments with metadata.

Example:

```
[
  {
    "fileName": "attachment.txt",
    "contentType": "text/plain",
    "mcontentBase64": [65,114,98,105,116,114,97]
  },
  {
    "fileName": "attachment2.txt",
    "contentType": "text/plain",
    "contentBase64": [77,111,114,101,32,97,114,98,105,116]
  }
]
```

Returns 200 OK if the attachments were stored successfully.

Retrieve attachments

GET /attachments/{messageId}

Returns a list of attachments with metadata for the specified message ID. Returns 200 OK with the attachments if found, or 404 Not Found if no attachments exist for the given message ID.
